Problem

AI is moving from recommendation to execution. Enterprise AI systems now call APIs, update infrastructure, generate code, interact with data, and support production workflows. Existing controls mostly evaluate what AI says, not what AI does.

Solution

QATI Enterprise is a pre-execution governance layer for AI-connected workflows. It evaluates authority, policy, risk, context, trust, and system state before execution, then allows, denies, delays, restricts, escalates, or routes actions to fallback with audit evidence.

Initial Markets

- Cybersecurity operations and security automation
- Financial systems and transaction workflows
- Enterprise AI platforms, agents, and copilots
- AI-assisted engineering, DevSecOps, and CI/CD
- Regulated operations and critical infrastructure

Business Model

Qlok earns revenue from QATI Enterprise licensing, usage-based governance checks, premium integrations, dedicated deployments, and qati.ai subscriptions.

Commercial Readiness

- QATI Enterprise platform and SDK commercially available
- QATI SDK MVP complete and operational
- Internal validation across 68 risk events and 7 datasets
- AWS Partner Central and Marketplace accounts active
- \$300K angel investment received

Defensibility

Qlok's defensibility is based on 10 AI and quantum-related patent filings, proprietary execution-control architecture, owned software, governance logic, validation scenarios, workflow risk controls, and QATI brand assets.

Current Seed Round

Qlok is raising \$200,000 to complete QATI Enterprise commercialization, AWS Marketplace integration, qati.ai launch, enterprise pilot readiness, and continued IP development. Indicative valuation: approximately \$30M pre-money, subject to final documentation.

Leadership

Edward R. Starrs, CEO
Founder, inventor, former public-company CEO, and technology commercialization executive.
